

I read that some people like radio amateurs are complaining about broadband over power lines interfering with their operations.

The question is : Broad band over telephone lines or cable lines , isn't interfering just as much ?

Because if it is the same , then those that are complaining are saying that the spread of broadband should be limited, for their pleasure, and smells just like the phone and cable companies with arterial motives, spreading misinformation thru multiple channels and fake sources.

And of course one should ask : just how far from the power line the alleged interference goes?

Are they complaining about not being able to set beneath a power line and operate a radio , when the internet is involved or it does not mater, the alleged interference is the same ?

Sincerely

John Yuga
